

Introducing Jaspr Health

Jaspr Health's digital platform enables delivery of suicide-prevention best practices at the point of need, in the ED or remotely, for evidence-based care. A companion app, *Jaspr-at-Home*, provides ongoing evidence-based support after the initial point of contact.

Preliminary findings from a randomized controlled trial support its efficacy in delivering evidence-based interventions, improving capacity to cope with suicidal ideation, and improving patient experience.

Virtual Guide

A conversation agent guides the patient through evidence-based risk assessment building a crisis stability plan to cope and reduce access to lethal means.

Clinical Decision Support

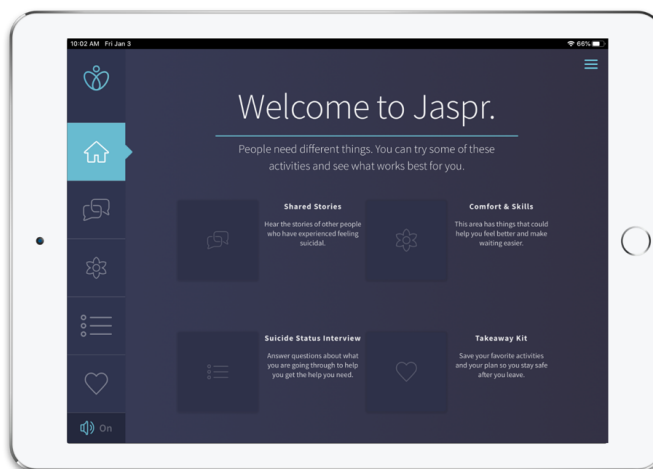

Easy-to-use summary of the suicide assessment, stability plan, lethal means counseling plan and other relevant information to determine optimal care.

Jaspr-at-Home

Supports patients through the high-risk period following their acute suicide crisis. They can access their coping plan and supportive content produced with their providers.

A Growing Need

Hospital emergency departments (ED) are a crucial front line to prevent suicide. During the COVID-19 pandemic, healthcare systems are turning to virtual care pathways to provide psychiatric emergency services to keep suicidal patients out of EDs.

Few providers are comfortable treating acutely suicidal individuals and lack training in suicide-prevention best practices.

Innovation in ED's

Virtual care pathways may become lasting solutions to treat suicidal patients post-COVID, because they help address the historic challenges EDs have faced with behavioral health emergencies: boarding, lost revenue, and poor patient satisfaction.
